**BUCKMAN WELLS 10-13 (RG-20516-S-10 THROUGH S-13)
MONITORING PROGRAM BIENNIAL REPORT
DECEMBER 2014**

EXECUTIVE SUMMARY

As required by the Buckman Monitoring Program (BMP) document titled *Buckman Well Field Water-Level Monitoring Program Response to Condition of Approval No. 5, Permit No. RG-20516-S-10 thru RG-20516-S-13, City of Santa Fe*, this biennial report summarizes production and water-level data in the City of Santa Fe's Buckman Well Field, documents water-level data and trends for BMP wells, provides 10-year and 40-year drawdown projections for wells in the BMP area, and addresses Permit Conditions 6 and 7, which address whether a set of wells may go dry as a result of pumping Buckman Wells 10 through 13 (BW10-13) under permit RG-20516-S-10 through RG-20516-S-13.

Under RG-20516 et al., the City is permitted to pump 10,000 acre-feet per year (ac-ft/yr) from the Buckman Well Field, and under RG-20516-S-10 through RG-20516-S-13 permit, the City is permitted to pump 6,000 ac-ft/yr of the total permitted 10,000 ac-ft/yr from BW10-13. Although the City will need the full permitted diversion amounts under RG-20516 et al. to meet current and future water demands in years when surface water resources are not available, the City has also prepared a forecast for future pumping. Both the forecasted future pumping scenarios, and a worst-case scenario with the full permitted amounts, were used to project future water-level declines in the BMP area.

The NMOSE superposition groundwater flow model of the Santa Fe area was used to model historical drawdowns, which were compared to historical water-level data for BMP wells to validate the use of the model to estimate future drawdowns over the 40-year period for (1) BMP area wells and, (2) table 30-A and 30-B wells (wells specifically identified in Finding 30 of NMOSE Order HU No. 03-004). The analysis included a forecasted future pumping scenario (realistic) and the worst-case scenario (full permitted amounts).

Based on the analysis, none of the BMP database wells or table 30-A or 30-B wells are projected to go dry under the forecasted pumping scenario. Several wells are projected to go dry, or have water columns reduced to less than 30 percent within the 40-year period under the worst-case scenario.

**BUCKMAN WELLS 10-13 (RG-20516-S-10 THROUGH S-13)
MONITORING PROGRAM BIENNIAL REPORT
DECEMBER 2014**

1.0 INTRODUCTION

As required by the Buckman Monitoring Program (BMP) document titled *Buckman Well Field Water-Level Monitoring Program Response to Condition of Approval No. 5, Permit No. RG-20516-S-10 thru RG-20516-S-13, City of Santa Fe*, this biennial report summarizes production and water-level data in the City of Santa Fe's Buckman Well Field, with a particular focus on Buckman Wells 10, 11, 12, and 13 (BW10-13), which were completed in 2003 (Fig. 1). This report also documents water-level data and trends for BMP wells.

Buckman Wells 1 through 9 (BW1-9) are permitted under New Mexico Office of the State Engineer (NMOSE) file number RG-20516 through RG-20516-S-9, and BW10-13 are permitted under NMOSE file numbers RG-20516-S-10 through RG-20516-S-13. The Buckman Well Field diversions and monitoring program water-level data summarized in this report are available in a Microsoft Excel spreadsheet on the City Water Division's web site, [http://www.santafenm.gov/buckman_wells_water_level_monitoring_program]. The spreadsheet contains:

1. Buckman Well Field production data in monthly time steps from 1981 through 2013;
2. water-level data collected by the City municipal water utility and by the U.S. Geological Survey (USGS) for the Buckman area;
3. graphs of water level changes over time.

1.1 Buckman Monitoring Program Requirements

To manage well field operations and to comply with RG-20516 et al. permit requirements, water-level data have been collected in the region for over 30 years. The water-level monitoring program was expanded with the permitting of BW10-13 in 2003. The current BMP area is a 50-square-mile area with a 4-mile radius centered at BW10-13 (see Fig. 1). The BMP requires water-level monitoring at specified wells in and around the BMP area at varying frequencies. BMP wells are listed in Table 1 and locations are shown on Figures 1 and 2.

^a Due to access and safety issues at RG-29524 (confined space in well vault), City has replaced RG-29524 with RG-81860 for semi-annual monitoring

^b Access has not been granted at RG-24584, City has replaced RG-24584 with RG-28112 for semi-annual monitoring

NMOSE - New Mexico Office of the State Engineer
 NMBGMR - New Mexico Bureau of Geology and Mineral Resources
 USGS - U.S. Geological Survey
 MP - monitoring program
 BW10-13 MP - Buckman Wells 10 through 13 monitoring program
 piez. - piezometer

Some changes and substitutions to the list of required monitoring wells have been necessitated by on-the-ground conditions. Water levels are measured at RG-81860 as an alternative to RG-29524 due to confined space entry issues at RG-29524. Water levels are measured at RG-28112 as an alternative to RG-24584, for which access has not been granted by the well owner. Water levels are measured at RG-79512 in order to fulfill the requirement that monitoring be performed at seven private 72-12-1 wells.

1.2 Buckman Monitoring Program Biennial Report Requirements

- Summarize RG-20516 production
- Summarize water-level trends in monitored wells
- 10-year and 40-year projection of water-level declines in monitored wells
- Projection of water-level declines for wells in the Monitoring Program area, or as specified in the RG-20516 permit
- 10-year and 40-year projections of water-level decline for one well near the western terminus of Tano Road Subdivision (currently met by making projections for well RG-77553 labeled “Tano” on maps)
- Starting/initial water columns in wells senior to RG-20516-S-10 through S-13 are to be determined from NMOSE Drillers’ Well Logs, actual static water-levels, site-specific studies, or a combination of these data
- Forecast whether remaining water column at the end of both projections will, in any monitored well, in any of the wells specifically identified in the Permit, or in any other senior well within BMP area, exceed 70 percent drawdown of the water column available at the initiation of monitoring program
- Map water-level trends in the monitored wells
- Post report and generalized map on-line for public access within 30 days of submittal to the NMOSE

1.3 Permit Conditions 6 and 7 Requirements

This BMP biennial report addresses Permit Conditions 6 and 7, which ensure access to water for well owners potentially impacted by the pumping of BW10-13. Permit Conditions 6 and 7 read as follows:

6. No water shall be diverted from wells RG-20516-S-10 through RG-20516-S-13 after December 31, 2010, until such time as the Permittee shall have furnished to the State Engineer such information and/or documents as the Engineer may find necessary to establish that any wells impacted under this Permit, including those wells identified in Table 30-A of Finding 30, will not go dry in 40 years, or that the owners of the right to beneficially use groundwater diverted from those wells have waived or released any claim of liability against the Permittee for impairment to such wells resulting from operations under this Permit, or that the Permittee has acquired the rights of such persons in such wells, or that the Permittee can and will, upon agreement of the well owners, supply water to such wells or the users thereof.
7. No water shall be diverted from wells RG-20516-S-10 through RG-20516-S-13 after December 31, 2043, until such time as the Permittee shall have furnished to the State Engineer such information and/or documents as the Engineer may find necessary to establish that any wells impacted under this Permit, including those wells identified in Table 30-B of Finding 30 of this Order, will not go dry due to Applicant's pumping authorized under this Permit, or that the owners or users of said wells have waived or released any claim of liability against the Permittee for injury resulting to such wells from operations under this permit, or that the Permittee has acquired the rights of such persons in such wells, or that the Permittee can and will supply water to such wells or the users thereof.

NMOSE Order HU No. 03-004, Finding 30, table 30-A lists wells that have the potential to go dry in 40 years as a result of BW10-13 pumping, and table 30-B lists wells that have the potential to go dry in 100 years as a result of BW10-13 pumping. All wells listed in table 30-A and table 30-B are included in Appendices B and C of this report.

2.0 BUCKMAN WELL FIELD (RG-20516 ET AL.) DIVERSIONS

2.1 Historical Diversions

A summary of Buckman Well Field diversions between 1981 and 2002 is presented in Table 2. Figures A1 through A14 in Appendix A present graphs showing historical Buckman Well field diversions and water levels. Between 1981 and 2002, total diversions from the Buckman Well Field ranged from 16 to 5,890 acre-feet per year (ac-ft/yr; Table 2). Under RG-20516 et al., the City is permitted to pump 10,000 ac-ft/yr from the Buckman Well Field.

BW - Buckman Well

bold - indicates well with maximum diversion

ac-ft - acre-feet

2.2 Diversions Since 2003

A summary of Buckman Well Field diversions between 2003 and 2014 is presented in Table 3. Figures A1 through A14 in Appendix A present graphs showing historical Buckman Well field diversions and water levels. BW10-13 began producing water for the municipal utility between October and December 2003. Between 2003 and 2014, total diversions from the Buckman Well Field have ranged from less than 1,000 up to 5,823 ac-ft/yr (Table 3), and diversions from BW10-13 have ranged from about 100 up to 3,378 ac-ft/yr. Under RG-20516-S-10 through RG-20516-S-13 permit, the City is permitted to pump up to 6,000 ac-ft/yr of the total permitted 10,000 ac-ft/yr from BW10-13.

Demand for groundwater supply from the Buckman Well Field is inversely related to surface water availability. When the City has adequate supply from its surface water resources, groundwater is conserved. However, during drought conditions, groundwater pumping is needed to make up for shortfalls in surface water supply.

2.3 Forecasted Diversions

Although the City will need the full permitted diversion amounts under RG-20516 et al. to meet current and future water demands in years when surface water resources are not available, the City has prepared a forecast for future pumping from BW10-13 in which the four wells pump a total of 4,800 ac-ft/yr for five years out of each 20-year future period, and a total of 1,000 ac-ft/yr for the remaining 15 years in each 20-year future period. The diversion amount 4,800 ac-ft/yr is roughly equivalent to a constant pumping rate of 3,000 gallons per minute, which was documented as the combined yield for BW10-13 in the final report for the wells (Street and Finch, 2004). The diversion amount 1,000 ac-ft/yr is approximately equal to the average historical diversion from BW10-13 to date (Table 3). The forecasted diversions do not consider the worst case scenario in which catastrophic fires eliminate or greatly reduce surface water supplies, requiring the City to be wholly dependent on groundwater and potentially utilizing up to the total permitted 10,000 ac-ft/yr under RG-20516 et al.

Table 3. Summary of Buckman Well Field diversions between 2003 and 2014

3.0 BUCKMAN MONITORING PROGRAM WATER-LEVEL TRENDS

3.1 Calculation of Water-Level Trends

This analysis of water-level trends focuses on an evaluation period from 2003 (when BW10-13 began pumping) to 2014. Water-level trends, presented as total drawdown during the evaluation period are shown in Table 4 and in Figure 2, and were calculated by subtracting the most recent non-pumping water level from the 2003 non-pumping water level (or earliest data point for wells for which pre-2004 data were not available). Positive numbers indicate a water-level rise and negative numbers represent a water-level decline.

3.2 Buckman Well Field

Although the effort was made to use only non-pumping water-level data in this analysis, water-level data from Buckman supply wells must be interpreted cautiously because non-pumping water levels reflect varying periods and degrees of recovery from pumping. The water-level datasets for these wells capture a range of conditions in and near the wells and not necessarily in the regional aquifer.

Non-pumping water levels in BW1-9 have been rising since 2003 as total Buckman Well Field pumping has been decreasing and approximately 30 percent of the total pumping has shifted to BW10-13 (Tables 3 and 4, Figs. 2, A2 through A10). Non-pumping water levels in BW10 and BW13 have declined since pumping began at BW10-13 in 2003 (Figs. A11 and A14). Non-pumping water levels in BW11 and BW12 indicate significant initial drawdowns when comparing the initial water-level measurements for the wells with subsequent non-pumping water-level data (Figs. A12 and A13).

Initial pumping likely removed an artesian head component at BW11 and BW12. The sonic log for BW11 indicated the top of saturation at 420 ft, but the initial non-pumping water level was measured near 280 ft or higher, indicating some artesian head (Street and Finch, 2004). The report states that “The combined pumping from Buckman Wells No. 10 through 13 will have some effect on the non-pumping water levels, particularly the artesian head component. The non-pumping water levels are assumed to decline by 140 ft under well field pumping conditions to 420 ft bgl.” Recent non-pumping water levels measured at BW11 are about 400 ft bgl.

Similarly, the final report and geophysical logs for BW12 indicate that the well appears to exhibit some artesian head (Street and Finch, 2004). The sonic log for BW12 indicated the top of saturation at 400 ft, but the initial non-pumping water level was measured near 260 ft or higher. Some artesian head appears to be present in the deepest part of the aquifer intermittently in the area spanning from Buckman piezometer south to BW12 (Fig. 2). This may be related to areas in which the channel-fill deposits of Lithosome S of the Tesuque Formation are overlain by claystone of Lithosome S or Lithosome B within certain fault segments (Fig. 3; Koning and Read, 2010). This is a characteristic unique to the deepest part of the aquifer within certain fault segments and is not representative of the aquifer as a whole, or the shallower part of the aquifer in which many of the BMP and domestic wells are completed. It should also be noted that well yields, as measured in 2011, were about 25 percent lower at BW11 and BW12 compared to BW10 and BW13 (Finch et al., 2012).

3.3 USGS Monitoring Wells

The USGS monitoring wells are non-pumping wells dedicated to water-level observation, which include piezometer nests that allow observation of water levels at multiple levels in the aquifer at six different locations (Figs. 2 and A15 through A20). Water levels have risen in 11 of the 15 piezometers monitored by USGS in and near the BMP area since 2003 (Table 3). The majority of the piezometers with water-level rises are in the vicinity of BW1-9, where pumping has decreased since 2003. Water-level rises were also observed in Las Campanas middle and deep piezometers. These data for Las Campanas piezometer bound the southern extent of drawdown in the middle and deep parts of the aquifer due to BW10-13 pumping.

The water levels in the USGS Buckman shallow, middle, and deep piezometers (SF-6C, B, and A, respectively) have declined since 2003 with significant initial drawdown in SF-6A when comparing the water-level data collected at the well between 2003 and 2006 to subsequent water-level data (Fig. A15). Water-level trends in SF-6A indicate a maximum water level decline of 104 ft since 2003 in a non-pumping observation well. Most of this drawdown occurred between 2003 and 2006, and, similar to initial drawdowns at BW11 and BW12 described in Section 3.2 above, likely represents the removal of the artesian head component in the deepest part of the aquifer within certain fault segments in the area between Buckman piezometer and BW12 (Fig. 2).

NMOSE - New Mexico Office of the State Engineer
 NMBGMR - New Mexico Bureau of Geology and Mineral Resources

USGS - U.S. Geological Survey
 ft bgl - feet below ground level

table 30-A - Finding 30, NMOSE Order HU No. 03-004

Note that the shallow (< 100 ft deep) USGS piezometers close to the Rio Grande, including SF-3C, SF-4C, and SF-5C, have historically had water-level variations that correlate to stages in the Rio Grande, and thus are not reflective of the groundwater system evaluated in this report.

3.4 Other Buckman Monitoring Program Wells

Other BMP wells include several wells measured under the BW1-9 monitoring program (Skillet, Permit, Weil Corral), wells equipped and actively-pumped for stock watering use (Tony's Windmill, Midway Windmill, and RG-81860) and domestic use (RG-25463), and unequipped wells (USFS, RG-30777, RG-28112, RG-79512, and RG-93871 (La Tierra Deep Monitoring Well); Figs. 1 and 2).

Water levels have generally declined by a total of 2 to 12 ft in the other BMP wells during the evaluation period 2003 to 2014 (Table 3, Figs. 2, A21 through A39). The hydrographs for RG-21318 Skillet Well and RG-439 Weil Corral show increases in water levels since 2003 (Figs. A40 through A43).

3.5 Interpretation of Water-Level Trends

Figure 2 presents water-level trends in terms of total water-level decline (or rise) during the evaluation period 2003 to 2014. Total water-level declines during the evaluation period are contoured in Figure 2.

3.5.1 Pumping Wells

Non-pumping water levels in BW1-9 have risen by 390 to 561 ft during the evaluation period 2003 to 2014, and have recovered to near-pre-pumping levels in BW2, BW4, BW7, and BW8 (Figs. 2, and A2 through A10). BW1-9 water levels have remained relatively stable in the last few years.

Non-pumping water levels in BW10 and BW13 have declined during the evaluation period, as pumping began at BW10-13 in 2003 (Fig. 2). Declines were 8 to 19 ft in BW10 and BW13, whereas declines were 128 to 161 ft in BW11 and BW12 during the evaluation period. The much larger declines in BW11 and BW12 primarily represent initial removal of the artesian head component observed at BW11 and BW12. As discussed in Section 3.2, the artesian head component at BW11 and BW12 is unique to the deepest part of the aquifer within certain fault segments and is not representative of the aquifer as a whole, or the shallower part of the aquifer in which many of the BMP and domestic wells are completed.

3.5.2 Zone of Influence

A total water-level decline of about 7 ft during the evaluation period at the USFS Well RG-29723 helps to define the limits of drawdown in the Caja del Rio horst block to the west of BW10-13 (Fig. 2). A 7-ft water-level decline over the 12-year evaluation period equates to an average decline rate of 0.6 feet per year (ft/yr).

Water-level declines of 2 ft or less at Las Campanas piezometer, RG-28112, RG-79512, and Tony's Windmill illustrate the southern and eastern extent of significant drawdown (Fig. 2). Significant drawdown is defined here as 2 ft over the 12-year evaluation period, which equates to an average decline rate of about 0.2 ft/yr; this average rate is significantly lower than the average regional decline rate documented in the area. In the NMOSE Order HU No. 03-004, the hearing examiner accepted testimony from NMOSE hydrologist Andy Core that regional water-level changes prior to the granting of and the pumping from the BW10-13 well permit range from 0.89 ft/yr rise and 7.41 ft/yr decline with an average regional decline rate of 1.18 ft/yr (Finding 27).

Water-level trends in the Buckman deep piezometer (SF-6A) indicate a maximum water level decline of 104 ft in a non-pumping observation well during the evaluation period 2003 to 2014. Most of this drawdown occurred between 2003 and 2006, and likely represents the removal of the artesian head component in the deepest part of the aquifer within certain fault segments in the area between Buckman piezometer and BW12 (Fig. 2). This is a characteristic unique to the deepest part of the aquifer within certain fault segments and is not representative of the aquifer as a whole, or the shallower part of the aquifer in which many of the BMP and domestic wells are completed. Water-level declines of 12 ft in Midway Windmill and Buckman shallow piezometer (SF-6C) are likely more representative of maximum water level declines during the evaluation period in the shallower part of the aquifer in which many of the BMP and domestic wells are completed.

3.5.3 Groundwater-Elevation Contours

Groundwater-elevation contours representative of the regional aquifer beneath the BMP area were prepared for years 2003 (Fig. 4) and 2014 (Fig. 5). Year 2003 represents groundwater-elevation contours before BW10-13 began pumping, and year 2014 represents current pumping conditions that include BW10-13. Direction of regional groundwater flow in the BMP area has generally been northeast toward BW1-9 and the Rio Grande. The contours indicate flatter

hydraulic gradient in the vicinity of Buckman piezometer and BW10, and southeast of BW13. The observed differences between the 2003 and 2014 flow fields reflect the removal of the artesian head component at BW11 and BW12 (5,900 and 6,000 ft amsl contours shifted to the southeast) and approximately 500 ft of water-level recovery at BW1-9.

4.0 GROUNDWATER FLOW MODEL ANALYSIS

4.1 Model Set-Up

The NMOSE revised superposition version of the McAda-Wasiolek (1988) groundwater flow model of the Santa Fe area (Core, 1996; Barroll and Keyes, 2005) was provided to John Shomaker & Associates, Inc. (JSAI) by NMOSE in September 2014. A Groundwater Vistas 6 (ESI, 2011) model file was provided for the revised superposition model with no pumping in the model file, and 100 one-year-long (31,557,600 seconds) stress periods. JSAI geo-referenced the model in Groundwater Vista 6 with a model origin (lower left corner) of $X = 378,489$ m, $Y = 3,932,124$ m, UTM83 Z13 ($X = 1,241,760$ ft, $Y = 12,900,644$ ft, UTM83 Z13), with no rotation of the model grid.

JSAI imported BW1-13, USGS monitoring wells, other BMP wells, and BMP database wells as observations wells in model Layer 1 and model Layer 2. JSAI prepared pumping files including historical BW1-13 pumping from 1981 through August 2014 and various future pumping scenarios through the end of 2054, for import into Groundwater Vistas. BW1-13 pumping was distributed equally in model Layer 1 and model Layer 2, as in the NMOSE well file that was included in the set of MODFLOW files also provided by NMOSE in September 2014.

4.2 Comparison to Observed Data

Model-simulated historical drawdown since 1981 due to BW1-13 pumping was plotted on water-level hydrographs in Appendix A. In order to plot model-simulated drawdown on hydrographs and compare to observed water levels, drawdown was fixed to an estimated starting water level for each well. Model-simulated historical water-level changes between 2003 and 2014 are presented in Figure 6 (model Layer 1) and Figure 7 (model Layer 2).

The model is inadequate for simulation of drawdown in pumping wells near the Rio Grande (BW1-9; Figs. A2 through A10), as the model likely simulates more water contributing from the river package in model Layer 1 and less from groundwater storage than actual. It should be noted that BW1, BW7, and BW8 plot within river cells (model cell dimensions are uniformly 1 mile by 1 mile), as do USGS monitoring wells SF-2(B,C), SF-3(A,B,C), SF-4(A,B,C), and SF-5C. As noted previously, shallow USGS piezometers SF-3C, SF-4C, and SF-5C, have historically had water-level variations that correlate to stages in the Rio Grande; thus, observed water levels for these piezometers should not be compared to model-simulated drawdown in model Layer 2 (Figs. A18 through A20).

Model-simulated drawdown in model Layer 2 tracks relatively closely to pumping and non-pumping water-level data for BW10-13 (Figs. A11 through A14); however, the model does not simulate the effects on the artesian head component at BW11, BW-12, or the Buckman piezometer (Figs. A12, A13, and A15). Model-simulated drawdown in model Layer 1 tracks relatively closely to water-level data in other BMP wells located farther from the river (Figs. A16, and A21 through A39).

The most recent water-level measurements for Midway Windmill suggest that water level declines may be increasing there, but more data are needed to determine whether this is a persistent trend. Based on field notes taken at the time of water-level data collection at the well in 2013 and 2014, it appears that water levels fluctuate at the well by up to 5 ft within a 10-minute period. It is unknown whether these fluctuations are related to recovery from a recent pumping cycle or other factors. Midway Windmill is equipped with a pump for stock use; the well also plots on an inferred south-southwest striking normal fault that passes near BW10.

Model-simulated drawdown has not tracked water-level trends since 1994 at Skillet well (Fig. A40). There has been very little recovery of water levels at Skillet well as a result of cessation of BW1-9 pumping. Skillet well is located north of the BMP area and northeast of BW1-9, and was completed to a depth of 1,700 ft in 1972; water-level declines in the well may reflect local hydrogeologic conditions that are not representative of the BMP area. The well record for Skillet well indicates “semi-artesian” conditions, possibly similar to BW11, BW12, and Buckman deep piezometer, and as noted above the model does not simulate the effects on the artesian head component.

4.3 Use of Buckman Monitoring Program Database Wells

JSAI imported BMP database wells as observations wells in model Layer 1 and model Layer 2. Model-simulated future drawdowns were used for water-level projections for the database wells. Projections could only be made for database wells for which depth-to-water and total depth information are available. Projections for BMP database wells are presented in Appendices B and C.

According to the requirements for the biennial report, one well from the Tano Road area is also included in Appendix B and C tables. The Tano Road area well, RG-77553, is located near the western boundary of the Tano Road area. RG-77553 was completed in T17N.R09E.04 in 2002, and drilled to a total depth of 900 ft. This well was selected for projections because the location has been verified (June 19, 2008 email from J.M. Smith), and the well record from 2002 likely gives a realistic estimate of the water column in the well around the time BW10-13 began pumping.

4.4 Model-Simulated Future Drawdown Effects

Ten-year (2015 to end of 2024) and 40-year (2015 to end of 2054) model-simulated future drawdowns were used for water-level projections for wells in the BMP area. Model-simulated drawdowns are larger in model Layer 2 than model Layer 1, so in order to take a conservative approach, drawdowns in Layer 2 were used for projections. Model-simulated future drawdowns under three different pumping scenarios were considered in the current study.

4.4.1 Scenario 1 Full RG-20516 et al. Permit

To evaluate the worst-case scenario, future pumping of the full permitted diversion amounts under RG-20516 et al. was simulated, with a total of 6,000 ac-ft/yr distributed equally among BW10-13, and a total of 4,000 ac-ft/yr distributed equally among BW1-9. This worst-case scenario is referred to as Scenario 1 in this report. Model-simulated water-level declines under Scenario 1 are presented in Figure 8 for the 10-year period, and in Figure 9 for the 40-year period. Water-level projections for wells in the BMP area under Scenario 1 are presented in Appendix B.

4.4.2 Scenario 2 Forecasted Demand From RG-20516 et al.

The City has prepared a forecast for future pumping from BW10-13 in which the four wells pump a total of 4,800 ac-ft/yr for five years out of each 20-year future period, and a total of 1,000 ac-ft/yr for the remaining 15 years in each 20-year future period, with pumping distributed equally among the four wells. A total of 4,000 ac-ft/yr is distributed equally among BW1-9. This forecast pumping scenario is referred to as Scenario 2 in this report, and is considered a realistic pumping scenario in contrast to the worst-case Scenario 1. Model-simulated water-level declines under Scenario 2 are presented in Figure 10 for the 10-year period, and in Figure 11 for the 40-year period. Water-level projections for wells in the BMP area under Scenario 2 are presented in Appendix C.

4.4.3 Baseline RG-20516 Scenario

In order to compare future Scenarios 1 and 2 to a future baseline scenario (i.e. what the City can divert from Buckman Well Field under existing permits granted prior to RG-20516-S-10 through RG-20516-S-13), future pumping of the full permitted diversion amount of 10,000 ac-ft/yr from BW1-9 was simulated. The total of 10,000 ac-ft/yr was distributed equally among BW1-9 in this future baseline scenario. Differences between model-simulated drawdowns for the 40-year period under Scenario 1 compared to baseline are presented in Figure 12, and under Scenario 2 compared to baseline are presented in Figure 13.

This future baseline scenario is not used in the projection of future drawdowns in this biennial report. Figures 12 and 13 are presented to aid in the reader's understanding of the difference between future pumping based on RG-20516-S-10 through RG-20516-S-13 (Scenarios 1 and 2), and a future baseline scenario representing existing permits granted prior to RG-20516-S-10 through RG-20516-S-13.

5.0 COMPLIANCE WITH PERMIT RG-20516-S-10 THROUGH RG-20516-S-13

5.1 NMOSE Review of 2012 Report

In a letter dated July 3, 2014, NMOSE Hydrology Bureau evaluated and provided comments on the City's previous Buckman Monitoring Program biennial report prepared in November 2012 (City of Santa Fe and Glorieta Geoscience, Inc., 2012). The NMOSE's summary of their evaluation included the following three points:

- Although we recognize that the 10- and 40-year projections are required by the monitoring plan and provide useful information, the trend analysis lacks interpretive meaning for anticipating pumping the wells at the permitted level.
- We think the analysis of the historical regional rate of decline is interesting, but is not appropriate to use for determining the background rate of decline in all areas within the Buckman monitoring program. Additionally, the timing, rates, and locations of pumping need to be considered when interpreting the pre- and post-2002 rates of decline.
- If Permit Conditions 6 and 7 are to be satisfied, an analysis is needed that considers what the impacts might be on wells in Tables 30-A and 30-B based on the full permitted diversion of 6000 afy from Buckman wells 10-13. This analysis would utilize the previously collected water-level data and pumping data and would involve some additional groundwater modeling.

In order to address NMOSE's comments and permit conditions, the City has used the NMOSE superposition model of the Santa Fe area and has simulated future pumping at the full permitted diversion amounts under RG-20516 et al. (Scenario 1) in the current study. In addition, the City has used the NMOSE superposition model to simulate historical BW1-13 pumping and drawdown effects, and compared model results to observed water-level changes. Simulating historical BW1-13 pumping allows for consideration of the timing, rates, and locations of pumping when interpreting pre- and post-2002 water-level changes. To meet the requirements of Permit Conditions 6 and 7, the City has evaluated the worst-case scenario of future pumping at the full permitted diversion amounts (Scenario 1) and model-simulated drawdown effects in model Layer 2 for water-level projections over the 10- and 40-year periods for wells included in Tables 30-A and 30-B of Finding 30, NMOSE Order HU No. 03-004.

5.2 Buckman Monitoring Program

The City is in compliance with the BMP through ongoing water-level monitoring, maintenance of the BMP database of wells and permits, reporting of BW1-13 diversion data and BMP water level data, and submittal of this biennial report.

To remain in compliance with the BMP, this biennial report identifies all BMP area wells for which water columns are projected to be reduced to less than 30 percent over the 10-year or 40-year periods due to pumping at the full permitted diversion amounts (future pumping Scenario 1) or based on forecasted demand (future pumping Scenario 2).

Appendix B presents projected 10-year and 40-year drawdowns for BMP area wells under future pumping Scenario 1, and Appendix C presents projected drawdowns for these wells under future pumping Scenario 2. Table 5 summarizes BMP area wells for which water columns are projected to be reduced to less than 30 percent over the 10-year or 40-year periods.

5.3 Permit Conditions 6 and 7

This biennial report addresses Permit Conditions 6 and 7 by identifying any Table 30-A and 30-B wells that may go dry over the 40-year period due to pumping at the full permitted diversion amounts (future pumping Scenario 1) or based on forecasted demand (future pumping Scenario 2).

The table 30-A and 30-B wells are wells specifically identified in Finding 30 of NMOSE Order HU No. 03-004 as potentially going dry in 40 years (table 30-A) or 100 years (table 30-B) as a result of the RG-20516-S-10 through RG-20516-S-13 permit. Appendix B presents projected 10-year and 40-year drawdowns for table 30-A and 30-B wells under future pumping Scenario 1, and Appendix C presents projected drawdowns for these wells under future pumping Scenario 2. Table 5 summarizes BMP area wells, including any table 30-A or 30-B wells, for which water columns are projected to be reduced to less than 30 percent over the 10-year or 40-year periods.

Table 5. Ten- and 40-year projections for Buckman Monitoring Program area wells for which water columns are projected to be reduced to less than 30 percent (see Appendices B and C for projections for additional BMP database wells)

6.0 CONCLUSIONS

- No table 30-A or 30-B wells or BMP database wells are projected to go dry under Scenario 2, the forecasted pumping scenario (Appendix C).
- Two table 30-B wells, Midway Windmill and USFS Well, are projected to go dry within the 40-year period due to pumping at the full permitted diversion amounts under Scenario 1 (Table 7).
- Four additional wells from the BMP database, Tony's Windmill, RG-30777, RG-89212-POD1, and M-18, are projected to have water columns reduced to less than 30 percent within the 40-year period due to pumping at the full permitted diversion amounts under Scenario 1. Tony's Windmill is located about 3.5 miles east of BW10 and BW11 and has a starting water column of 56 ft. Wells RG-30777 and RG-89212-POD1 are located within 0.5 mile east of BW13 and both have a starting water column of 120 ft. Well M-18 referenced from Mourant (1980), is located about 1.9 miles east of Midway Windmill, likely drilled for livestock watering use, and had a starting water column of 36 ft in 1961. Note that wells RG-89212-POD1 and M-18 have not yet been field-verified in terms of their existence, completion, and location.
- It should be noted that Midway Windmill is also projected to go dry, and M-18 projected to have water column reduced to less than 30 percent, within the 40-year period under the baseline pumping scenario (10,000 ac-ft/yr from BW1-9).
- No table 30-A wells are projected to go dry within the 40-year period due to pumping at the full permitted diversion amounts under Scenario 1 (Appendix B).
- After 40 years, Tano Road area well RG-77553 is projected to have 97 percent of its starting water column under Scenario 1 (full permitted diversion). Water-level declines in the Tano Road area are projected to be 10 ft or less over the 40-year period due to Buckman Well Field pumping (Fig. 9).
- The City has addressed NMOSE comments on the 2012 biennial report and Conditions 6 and 7 by using the NMOSE superposition model to simulate BW1-13 pumping and drawdown effects, and using drawdown results from Scenario 1 (full permitted diversion amounts) in model Layer 2 to project water-level declines over the 40-year period.
- Additional drawdown over the 40-year period in the BMP area under the Scenario 2 forecasted pumping scenario is projected to be minimal in comparison to the baseline scenario (Fig. 13). The baseline scenario simulates 10,000 ac-ft/yr from BW1-9 as permitted prior to RG-20516-S-10 through RG-20516-S-13, whereas Scenario 2 forecasts annual diversions ranging from 5,000 to 8,800 ac-ft/yr (4,000 ac-ft/yr from BW1-9 and 1,000 to 4,800 ac-ft/yr from BW10-13).

7.0 RECOMMENDATIONS

- Continued monitoring at Midway Windmill, USFS Well, Tony's Windmill, and RG-30777 will help the City ensure that the wells maintain sufficient water columns under actual Buckman Well Field pumping conditions to remain in compliance with RG-20516 permit requirements.
- RG-89212-POD1 and M-18 need to be field-verified in terms of their existence, completion, and location. RG-89212-POD1 is reported to be very close to RG-30777, with a similar completion as RG-30777.
- The City may work towards installing a transducer to record hourly water-level measurements in actively-pumped stock well Midway Windmill. The most recent water-level measurements for Midway Windmill suggest that water level declines may be increasing there, but more data are needed to determine whether this is a persistent trend. Based on field notes taken at the time of water-level data collection at the well in 2013 and 2014, it appears that water levels fluctuate at the well by up to 5 ft within a 10-minute period. It is unknown whether these fluctuations are related to recovery from a recent pumping cycle or other factors; transducer data would help with identification of water-level fluctuations and trends in the well, and potential factors influencing water-level fluctuations and trends in the well.

Figure A23. Water levels in Tony Windmill well (RG-6386) and monthly diversions from Buckman Wells 10 through 13, 2003 through 2014.

Figure 24. Water levels in Tony Windmill well (RG-6386) and model-simulated drawdown with future pumping Scenario 1 (full permitted diversion amounts).

Figure A25. Water levels in well RG-25463 and monthly diversions from Buckman Wells 10 through 13, 2003 through 2014.

Figure A26. Water levels in well RG-25463 and model-simulated drawdown with future pumping Scenario 1 (full permitted diversion amounts).

Figure A27. Water levels in well RG-30777 and monthly diversions from Buckman Wells 10 through 13, 2003 through 2014.

Figure A28. Water levels in well RG-30777 and model-simulated drawdown with future pumping Scenario 1 (full permitted diversion amounts).

Figure A29. Water levels in well RG-28112 and monthly diversions from Buckman Wells 10 through 13, 2003 through 2014.

Figure A30. Water levels in well RG-28112 and model-simulated drawdown with future pumping Scenario 1 (full permitted diversion amounts).

Figure A31. Water levels in well RG-79512 and monthly diversions from Buckman Wells 10 through 13, 2003 through 2014.

Figure A32. Water levels in well RG-79512 and model-simulated drawdown with future pumping Scenario 1 (full permitted diversion amounts).

Figure A33. Water levels in La Tierra deep monitoring well RG-93871 and monthly diversions from Buckman Wells 10 through 13, 2003 through 2014.

Figure A34. Water levels in well RG-81860 and monthly diversions from Buckman Wells 10 through 13, 2003 through 2014.

Figure A35. Water levels in well RG-81860 and model-simulated drawdown with future pumping Scenario 1 (full permitted diversion amounts).

Figure A36. Water levels in U.S. Forest Service well (RG-29723) and monthly diversions from Buckman Wells 10 through 13, 2003 through 2014.

Figure A37. Water levels in U.S. Forest Service well (RG-29723) and model-simulated drawdown with future pumping Scenario 1 (full permitted diversion amounts).

Figure A38. Water levels in Permit well (RG-16681) and monthly diversions from Buckman Wells 10 through 13, 2003 through 2014.

Figure A39. Water levels in Permit Well (RG-16681) and model-simulated drawdown with future pumping Scenario 1 (full permitted diversion amounts).

Figure A40. Water levels in Skillet well (RG-21318) and monthly diversions from Buckman Wells 10 through 13, 1981 through 2014.

Figure A41. Water levels in Skillet Well (RG-21318) and model-simulated drawdown with future pumping Scenario 1 (full permitted diversion amounts).

Figure A42. Water levels in Weil Corral well (RG-439) and monthly diversions from Buckman Wells 10 through 13, 1981 through 2014.

Figure A43. Water levels in Weil Corral Well (RG-439) and model-simulated drawdown with future pumping Scenario 1 (full permitted diversion amounts).

Appendix B.

**Ten- and 40-year water column projections for Buckman Monitoring Program database wells due to pumping at the full permitted diversion amounts
(Scenario 1, model Layer 2)**

Appendix B. Ten- and 40-year water column projections for Buckman Monitoring Program wells due to pumping at the full permitted diversion amounts (Scenario 1, model layer 2)
